MULTIPLE CHOICE

1. The dental professional MUST be thoroughly familiar with the surface anatomy of the head and neck in order to examine patients BECAUSE features of the surface provide essential landmarks for deeper anatomic structures.
   a. Both the statement and the reason are correct and related.
   b. Both the statement and the reason are correct but NOT related.
   c. The statement is correct, but the reason is NOT.
   d. The statement is NOT correct, but the reason is correct.
   e. NEITHER the statement NOR the reason is correct.

   ANS: A

   Feedback
   A Both the statement and reason are correct, and they are also both related. Dental professionals MUST have knowledge of healthy structures in order to identify and locate deeper anatomic landmarks that are necessary in order to perform certain dental procedures such as administration of local anesthetic or radiographic exposures.
   B Both the statement and the reason relate to each other. The dental professional MUST have knowledge of anatomic structures in order to complete certain dental procedures.
   C The reason is correct. The dental professional MUST have knowledge of anatomic structures in order to complete certain dental procedures.
   D The statement is correct. The dental professional MUST have knowledge of anatomic structures.
   E The statement and the reason are both correct. Dental professionals MUST have knowledge of healthy structures in order to identify and locate deeper anatomic landmarks that are necessary in order to perform certain dental procedures.

5. The eyeball is located in the orbital region of the head. On the eyeball is a white area with a central area of coloration. What is the term for the white area?
   a. Sclera
   b. Iris
   c. Pupil
   d. Orbit

ANS: A

Feedback
A The sclera is the white area on the eyeball.
B The iris is the central area of coloration on the eyeball.
C The pupil is the opening in the center of the iris that appears black.
D The orbit is the bony socket where the eyeball is contained.

6. Which part of the nasal region will feel flexible when palpated during an extraoral examination by a clinician?
   a. Root of the nose
   b. Apex of the nose
   c. Bridge of the nose
   d. Nasion of the nose

ANS: B

Feedback
A The root of the nose is a bony structure located between the eyes.
B The apex of the nose is formed by cartilage located at the tip of the nose.
C The bridge of the nose is a bony structure located inferiorly to the nasion.
D The nasion is a midline junction between the nasal and frontal bones.

10. What is the landmark located in the oral cavity that appears as a small elevation of tissue located on the inner part of the buccal mucosa, just opposite the maxillary second molar?
   a. Parotid papilla
   b. Maxillary tuberosity
   c. Labial frenum
   d. Retromolar pad

ANS: A

Feedback
A The parotid papilla is located on a small elevation of tissue containing the duct opening from the parotid gland on the inner part of the buccal mucosa opposite the maxillary second molar.
B The maxillary tuberosity is located posterior to the maxilla.
C The labial frenum is a fold of tissue located at the midline between the labial mucosa and alveolar mucosa of the maxilla and mandible.
The retromolar pad is a dense pad of tissue distal to the most distal tooth of the mandible.

D The nasolabial sulcus is the groove that runs upward between the labial commissure and the ala of the nose.

17. Where are foliate lingual papillae located within the oral cavity?
   a. Dorsal surface of the tongue
   b. Buccal mucosa
   c. Anterior hard palate
   d. Lateral border of the tongue

   ANS: D

   Feedback
   A The dorsal surface of the tongue has the filiform, fungiform, and circumvallate lingual papillae.
   B The foliate lingual papillae are located on the lateral border of the tongue.
   C The foliate lingual papillae are located on the lateral border of the tongue.
   D The foliate lingual papillae are located on the lateral border of the tongue.

18. Trying to fully survey the areas of the scalp during an extraoral examination is NOT very important because lesions are easily visualized by the patient and then can be shared with the clinician.
   a. Both the statement and the reason are correct and related.
   b. Both the statement and the reason are correct but NOT related.
   c. The statement is correct, but the reason is NOT.
   d. The statement is NOT correct, but the reason is correct.
   e. NEITHER the statement NOR the reason is correct.

   ANS: E

   Feedback
   A Neither the statement nor the reason is correct. Trying to fully survey these areas of the scalp during an extraoral examination is important because lesions may be hidden visually from the clinician as well as the patient’s hair.
   B Neither the statement nor the reason is correct. Trying to fully survey these areas of the scalp during an extraoral examination is important because lesions may be hidden visually from the clinician as well as the patient’s hair.
   C Neither the statement nor the reason is correct. Trying to fully survey these areas of the scalp during an extraoral examination is important because lesions may be hidden visually from the clinician as well as the patient’s hair.
Neither the statement nor the reason is correct. Trying to fully survey these areas of the scalp during an extraoral examination is important because lesions may be hidden visually from the clinician as well as the patient’s hair.

Neither the statement nor the reason is correct. Trying to fully survey these areas of the scalp during an extraoral examination is important because lesions may be hidden visually from the clinician as well as the patient’s hair.

19. The frontal eminence is usually MORE pronounced in males, and the supraorbital ridge is MORE prominent in females and children.
   a. Both statements are true.
   b. Both statements are false.
   c. The first statement is true; the second is false.
   d. The first statement is false; the second is true.

ANS: B

Feedback

A  Both statements are false. The frontal eminence is usually more pronounced in children and adult females, and the supraorbital ridge is more prominent in adult males.

B  Both statements are false. The frontal eminence is usually more pronounced in children and adult females, and the supraorbital ridge is more prominent in adult males.

C  Both statements are false. The frontal eminence is usually more pronounced in children and adult females, and the supraorbital ridge is more prominent in adult males.

D  Both statements are false. The frontal eminence is usually more pronounced in children and adult females, and the supraorbital ridge is more prominent in adult males.

20. The eyes are usually near the midpoint of the vertical height of the head. The width of each eye is usually the same as the distance between the ears.
   a. Both statements are true.
   b. Both statements are false.
c. The first statement is true; the second is false.
d. The first statement is false; the second is true.

6. Which of the following needs to occur in order to effectively visually inspect and bidigitally palpate the vestibular area and gingival tissue during an intraoral examination on patient? (*Select all that apply.*)
   a. Retracting buccal mucosa
   b. Placing mouth mirror on dorsal surface of tongue
c. Retracting labial mucosa
d. Having patient say “ah”

ANS: A, C

7. Which of the following needs to occur in order to effectively examine the dorsal surface of the tongue during an intraoral examination on a patient? (Select all that apply.)
   a. Extending tongue slightly
   b. Wrapping gauze around tongue
   c. Grasping of tongue firmly
   d. Digitally palpating surface

ANS:  A, B, C, D

To examine the dorsal surface of the tongue, have the patient slightly extend the tongue and wrap gauze around the anterior third of the tongue in order to obtain a firm grasp. First, visually inspect and then digitally palpate the dorsal surface.

DIF: Application  REF:  p. 20      OBJ:  2
TOP:  CDA: General Chairside, I. A. Demonstrate understanding of basic oral and dental anatomy, physiology, and development | CDA: General Chairside, II. C. Describe how to perform and/or assist with intraoral procedures

8. Which of the following are palpable landmarks of the midline of the neck during an extraoral examination by a dental professional? (Select all that apply.)
   a. Thyroid cartilage
   b. Vocal cords or ligaments
   c. Superior thyroid notch
   d. Hyoid bone

ANS:  A, C, D

Correct

The thyroid cartilage and its superior thyroid notch as well as the hyoid bone are palpable landmarks of the midline of the neck during an extraoral examination.

Incorrect

The vocal cords or ligaments of the larynx or “voice box” are attached to the posterior surface of the thyroid cartilage and thus are not palpable during an extraoral examination. Instead, a laryngoscopy is an examination by medical personnel that examines the posterior surface of the larynx.
the pharynx as well as the vocal cords or ligaments of the larynx using a laryngoscope.

9. Which of the following needs to occur in order to effectively examine the floor of the mouth during an extraoral examination on a patient? (Select all that apply.)
   a. Observe salivary flow from sublingual caruncle ducts
   b. Check midline lingual frenum
   c. Observe salivary flow from parotid papillae ducts
   d. Check midline labial frenum

ANS: A, B
